FAGOR *8035* CNC

FAGOR

Unmatched operating ease with so many features

The FAGOR 8035 CNC, thanks to its operating ease and its numerous features, is the ideal CNC for 3-axis milling machines and machining centers as well 2-axis lathes and other kinds of machines (engraving, routers, Oxicutting, etc.).

It's operating ease makes the operator's job easier; the screen offers the operator all the necessary information: axis position and feedrate, spindle speed, selected tool, etc.

This CNC is available in twelve languages: English, Spanish, Portuguese, Chinese, Russian, French, Italian, German, Dutch, Czech, Polish and Basque.

ISO language programming

The FAGOR 8035 CNC is programmed in ISO language, it offers an interactive canned cycle editor, Teach-in editing, tool inspection, etc.

The "T" model for lathes and the "M" model for milling models and machining centers come with ten canned cycles and all the specific operations your machine needs.

Interactive editor for canned cycles

It is a dialog-based guided editing method. The CNC guides the operator through the help screens that request the data for the selected operation. No expert ISO programming knowledge is required, just the basics.
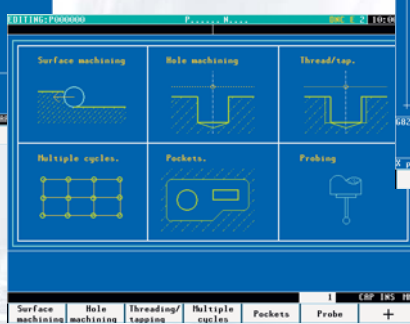

The quality of the generated programs is excellent. This editing method only lets enter the requested data, thus being impossible to generate wrong or incomplete blocks.

Interactive editor, T
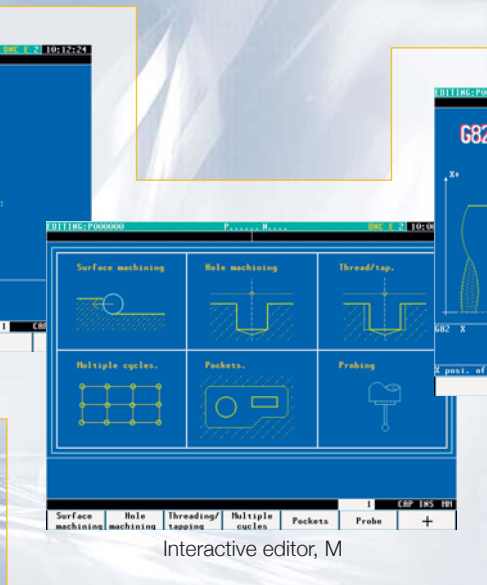

Interactive editor, M

Facing

Teach-in editing

It is an interactive mode that allows the CNC to operate as a manual machine. To program the coordinates, just jog the machine with the JOG keys or with the electronic handwheel to the desired position and press the key of the axis or axes to be programmed. The CNC generates a block to move to that position.
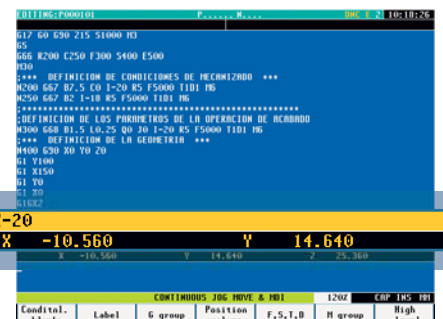

Tool Inspection

Tool inspection makes the operator's job easier allowing him to move the axes after interrupting the program, to check tool status, replace it if necessary and resume the program after repositioning the axes.

The new selected tool needs not be identical to the previous one; if another tool of different characteristics is selected, the CNC recalculates the next machining operation according to the new tool.

Likewise, activating the MDI mode during tool inspection and executing any M, S or T function makes it possible to adapt the machining functions to the new tool.

Great memory capacity

It has a 256 KB RAM memory for editing and executing part-programs and it may be expanded up to 1 MB. It also has a 128 MB compact flash memory for storing user programs, the CNC configuration and the PLC program.

USB connector

The USB connector may be used to upload and download part-programs, tables and parameters from/to an external memory device.

Working with CAD-CAM

For those who use CAD-CAM , the 8035 CNC converts and executes, through WIN DNC, files and profiles generated in DXF format.

Program compatibility

The WINDNC application may be used to run at the 8035 CNC programs that were edited at older CNC models 8000, 8010 and 8025.

Thread cutting operations

On lathe models, besides the typical turning operations (turning, grooving, facing, etc.), it is possible to make all kinds of threads: longitudinal, taper, on the face, with variable pitch, etc. Multiple-entry (multi-start) threads can also be defined.

The thread repair function offered by the 8035 CNC is ideal for restoring parts having worn out threads.

Retrace function

It makes it possible to interrupt a machining operation and withdraw the tool following the same machining path backwards. It is very useful in applications that due to the way machining is done do not allow any other way to withdraw the tool: EDM, laser cutting, plasma cutting, etc.

This feature prevents possible damage to the part or having to perform complex operations to withdraw the tool.

Backed by a worldwide leader group

FAGOR AUTOMATION has been manufacturing measuring and control systems for machine-tools for over 25 years and excels by guaranteeing the most complete and competitive range of CNC's, servo drive systems, DRO's and feedback systems.

FAGOR AUTOMATION exports over 79% of its total production to the industrialized world through a significant distribution network worldwide (more than 24 branch offices in 15 countries). All this with a matchless after-sales service.

FAGOR AUTOMATION is part of Mondragón Cooperative Corporation, one of the most important European corporations, with more than 160 companies and more than 80,000 employees in three divisions: Financial, Distribution and Industrial. The industrial division FAGOR AUTOMATION belongs to covers a wide range of industrial sectors and it occupies leading positions in all of them.
